## **DETAILED ACTION**

### ***Election/Restrictions***

1. Claims 20-29 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on 20 October 2008.
2. Applicant's election without traverse of the invention of group I in the reply filed on 20 October 2008 is acknowledged.
3. This application is in condition for allowance except for the presence of claims 20-29 directed to the invention of group II non-elected without traverse. Accordingly, claims 20-29 have been cancelled.

### ***Allowable Subject Matter***

4. Claims 1-19 are allowed.
5. The following is an examiner's statement of reasons for allowance: the prior art does not disclose or suggest "operable at the end of the charging phase to transfer charge from the voltage supply to at least the second charge storage device via an energy storage device prior to a subsequent discharge phase" in combination with the remaining claim elements of claim 1.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

***Conclusion***

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Hoffmann et al. (US 6606814) and Cheever et al. (US 2004/0057189) both disclose drive circuit for injector arrangements having first and second charge storage elements, switch controllers, first and second voltage rails, and a regeneration switch; however, neither discloses that the regeneration switch is operable at the end of the charging phase to transfer charge from the voltage supply to at least the second charge storage device via an energy storage device prior to a subsequent discharging phase. Ripoll (EP 1398488 A1) discloses a drive circuit having an energy storage device between the voltage source and a capacitor; however, the capacitor is a filtering capacitor, and is not operable at the end of a charging phase to transfer charge from the voltage supply to the capacitor via the energy storage device prior to a subsequent discharging phase.
